**INTRODUCTION** by *Ronald D. Guttman, M.D.* . . . page 5

**IMMUNOGLOBULINS** by *David Papermaster, M.D.*

Immunoglobulins can be divided into several classes on the basis of unique antigenic determinants present on the different portions of the molecule. These classes are beginning to correlate with the various functions of antibody as we now know them . . . . . page 7

**REAGIN ALLERGY** by *Michael K. Bach, Ph.D.*

A trace immunoglobulin in the blood (IgE) can, by virtue of its ability to fix to basophils and mast cells, cause the immunologic release of histamine and other mediators of anaphylaxis. An understanding and pharmacologic manipulation of this process is the basis of treatment of atopy . . . . . page 19

**IMMEDIATE HYPERSENSITIVITY**

by *Richard R. Lindquist, M.D.*

Just how do antigen-antibody interactions induce tissue injury? Although not all the answers are available, this article presents material that improves our understanding of the problem . . . . . page 33

**CELLULAR IMMUNOLOGY** by *Henry N. Claman, M.D.*

The two universes of immunological response (cellular and humoral) are governed in great part by T and B lymphocytes, respectively. T lymphocytes are responsible for cellular reactions. B lymphocytes (with or without "help" from T cells and macrophages) are responsible for antibody production. Complex interrelations between these cells and processes allow "fine tuning" of the immune response . . . . . page 45

**CELLULAR IMMUNITY AND HYPERSENSITIVITY**

by *John R. David, M.D.*

Once considered an arcane skin response to tuberculin, delayed hypersensitivity is now known to be a complex immunologic process related to almost every aspect of medicine . . . . . page 55

**TRANSPLANTATION IMMUNOLOGY**

by *Ronald D. Guttman, M.D. and John P. Merrill, M.D.*

The implications of transplantation immunology go far beyond simple trading of organs. New insights have been gained that offer great promise for future clinical application . . . . . page 69

**TUMOR IMMUNOLOGY** by *Charles F. McKhann, M.D.*

Organ transplantation has shown the highly specific and complex antigenic makeup of the individual. New data on tumor makeup provides meaningful clues for earlier diagnosis and effective immunization for cancer . . . . page 79

**IMMUNOSUPPRESSION** by *Robert S. Schwartz, M.D.*

The art of immunosuppression has grown rapidly in the pressurized atmosphere of clinical practice. The rationale is based on our new understanding of the complexities of the immune system . . . . . page 89
